ON EBX™

DATASHEET

EBX® master data management

Manage, govern and share master data, reference data and metadata in one model-driven, multi-domain platform, and give operations, analytics and AI a trusted foundation.

OVERVIEW

Everything you need to manage, govern and share data

For more than two decades, EBX has helped define master data management. It brings together everything organizations need in a single platform, and creates maximum flexibility through fully configurable applications generated directly from your data model.

Model any domain, from customers, products and suppliers to locations, assets and finance, with the reference data and metadata that give it meaning.

Multi-domain
Any domain and relationship in one platform

Model-driven
Applications generated from the data model

AI-ready
Governed context for analytics, models and agents

Operations

- Maintain and synchronize a single source of truth with semantic reconciliation
- Coordinate the value chain with master, reference and metadata
- Collaborate across the enterprise with team features and visualization
- Manage multiple domains with stewardship and governance

Analytics

- Deliver valid, consistent data in the form analytics and reporting tools need
- Turn complex conformed dimensions into simple structures such as hierarchies
- Give data scientists and AI teams governed, explainable inputs

Compliance

- Maintain regulatory, legislative and corporate compliance
- Create policies and controls, and monitor their adoption and impact
- Keep a full record of evidence, with history and audit trails
- Manage technical information centrally under governance controls

WHY EBX

Built to grow with your data and your business

Model-driven design

An agile design tool generates applications and user interfaces for authoring, data stewardship, workflow, hierarchy management and integration. What you model is what you get.

Multi-domain

Forget one domain per silo. Master and model every domain and relationship, including reference data and metadata, in one solution built multi-domain from the start.

Smart and scalable

Whether you manage thousands or billions of records, EBX scales with you. Start small and grow without retooling.

All-in-one

Workflow, data quality, matching, hierarchies, versioning and role-specific features come out of the box, ready to configure.

Business-focused

Self-service capabilities and collaborative governance put business users, not only data experts and developers, at the center of adoption.

Governed data services

Publish and share trusted data on demand through APIs and services, with permissions and history applied.

AI-READY

Trusted context for AI

AI models and agents are only as reliable as the data and context behind them. EBX supplies both.

- Model Context Protocol (MCP) servers out of the box, so AI assistants and agents work with EBX data, models and workflows within existing permissions
- Relationships, hierarchies and definitions that tell models how entities connect
- AI that proposes matches, classifications and rules, and data stewards who approve them

DEPLOYMENT

On-premises

Run EBX in your own data centers under your own controls.

Hybrid

Connect on-premises and cloud systems through one governed platform.

Cloud-supported

Deploy EBX on the cloud infrastructure your organization chooses.

DOMAINS ORGANIZATIONS MASTER WITH EBX

- Customer and party
- Product and catalog
- Supplier and vendor
- Location and site
- Asset and equipment
- Employee
- Finance and chart of accounts
- Legal entity
- Reference data and code lists
- Hierarchies
- Metadata and business glossary
